An answer: The mathematical variable

<https://powcoder.com>

## Assignment Project Exam Help

Add WeChat powcoder

What is the [Assignment Project Exam Help](https://powcoder.com) single most important mathematical concept ever developed in human history?

Add WeChat powcoder

An answer: The mathematical variable

(runner up: natural numbers/induction)

## Why is the mathematical variable so important?

The mathematician says:

“Let  $x$  be some integer, we define a polynomial over  $x$  ...”

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# Why is the mathematical variable so important?

The mathematician says:

“Let  $x$  be some integer, we define a polynomial over  $x$  ...”

What is going on here? The mathematician has separated a *definition* (of  $x$ ) from its *use* (in the polynomial).

This is the most primitive kind of *abstraction* ( $x$  is *some* integer)

*Abstraction* is the key to controlling complexity and without it, modern mathematics, science, and computation would not exist.

It allows *reuse* of ideas, theorems ... functions and programs!

## **OCAML BASICS: LET DECLARATIONS**

## Assignment Project Exam Help Abstraction

- Good programmers identify repeated patterns in their code and factor out the repetition into meaningful components
- In O'Caml, the most basic technique for factoring your code is to use **let expressions**
- Instead of writing this expression:

<https://powcoder.com>

$(2 + 3) * (2 + 3)$

Add WeChat powcoder

## Assignment Project Exam Help Abstraction & Abbreviation

- Good programmers identify repeated patterns in their code and factor out the repetition into meaningful components
- In O'Caml, the most basic technique for factoring your code is to use **let expressions**
- Instead of writing this expression:

<https://powcoder.com>

$(2 + 3) * (2 + 3)$

Add WeChat powcoder

- We write this one:

```
let x = 2 + 3 in  
x * x
```

## A Few More Let Expressions

Add WeChat powcoder

```
let x = 2 in  
let squared = x * x in  
let cubed = x * squared in  
squared * cubed
```

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

## A Few More Let Expressions

Add WeChat powcoder

```
let x = 2 in  
let squared = x * x in  
let cubed = x * squared in  
squared * cubed
```

Assignment Project Exam Help

<https://powcoder.com>

```
let a = "a" in  
let b = "b" in  
let as = a ^ a ^ a in  
let bs = b ^ b ^ b in  
as ^ bs
```

Add WeChat powcoder

## Assignment Project Exam Help & Abbreviation

- Two kinds of let:  
[Add WeChat powcoder](#)

```
if tuesday() then  
  let x = 2 + 3 in  
    x + x  
else  
  0
```

```
let x = 2 + 3  
let y = x + 17 / x
```

**let ... in ...** is an *expression* that can appear inside any other *expression*

The scope of x does not extend outside the enclosing “in”

**let ... without “in”** is a top-level *declaration*

Variables x and y may be exported; used by other modules

(Don’t need ;; if another let comes next; do need it if the next top-level declaration is an expression)

## Assignment Project Exam Help

- Each OCaml variable is bound to 1 value
- *The value to which a variable is bound to never changes!*

let x = 3  
Assignment Project Exam Help

let add\_three (y:int) : int = y + x

Add WeChat powcoder

## Assignment Project Exam Help

- Each OCaml variable is bound to 1 value
- *The value to which a variable is bound to never changes!*

let x = 3  
Assignment Project Exam Help

let add\_three (y:int) : int = y + x

Add WeChat powcoder

*It does not  
matter what  
I write next.  
add\_three  
will always  
add 3!*

# Assignment Project Exam Help

- Each OCaml variable is bound to 1 value
- *The value a variable is bound to never changes!*

a distinct  
variable that  
"happens to  
be spelled the  
same"

Assignment Project Exam Help

```
let add_three (y:int) : int = y + x
```

Add WeChat powcoder

```
let x = 4
```

```
let add_four (y:int) : int = y + x
```

## Assignment Project Exam Help

- Since the 2 variables (both happened to be named x) are actually different, unconnected things, we can rename them

rename x  
to zzz  
**if you want  
to, replacing  
its uses**

## Assignment Project Exam Help

```
let add_three (y:int) : int = y + x
```

Add WeChat powcoder

```
let zzz = 4
```

```
let add_four (y:int) : int = y + zzz
```

```
let add_seven (y:int) : int =  
    add_three (add_four y)
```

# Assignment Project Exam Help

- Each OCaml variable is bound to 1 value
- OCaml is a **statically scoped** (or **lexically scoped**) language

we can use  
add\_three  
without worrying  
about the second  
definition of x

## Assignment Project Exam Help

```
let add_three (y:int) : int = y + x
```

## Add WeChat powcoder

```
let x = 4
```

```
let add_four (y:int) : int = y + x
```

```
let add_seven (y:int) : int =
  add_three (add_four y)
```

## Assignment Project Exam Help How do let expressions operate?

let y = 4      in  
y * 2
```

## Assignment Project Exam Help Another Example

Add WeChat powcoder

```
let x = 2 in  
let y = x + x in  
y * x
```

substitute  
2 for x

-->

let y = 2 + 2 in  
y \* 2

Assignment Project Exam Help  
<https://powcoder.com>

Add WeChat powcoder

substitute

-->

```
let y = 4      in  
y * 2
```

4 for y

-->

4 \* 2

## Assignment Project Exam Help

### Another Example

Add WeChat powcoder  
let x = 2 in  
let y = x + x in  
y \* x

substitute  
2 for x

-->

Assignment Project Exam Help  
let y = 2 + 2 in  
y \* 2  
<https://powcoder.com>

Moral: Let  
operates by  
*substituting*  
computed values  
for variables

-->

Add WeChat powcoder  
let y = 4 in  
y \* 2

substitute  
4 for y

-->

4 \* 2

-->

# **OCAML BASICS: FUNCTIONS**

## Assignment Project Exam Help Defining functions

Add WeChat powcoder

```
let add_one (x:int) : int = 1 + x
```

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

## Assignment Project Exam Helps

Add WeChat powcoder

let keyword

```
let add_one (x:int) : int = 1 + x
```

function name

argument name

Add WeChat powcoder

<https://powcoder.com>

Assignment Project Exam Help

type of argument

type of result

expression  
that computes  
value produced  
by function

Note: recursive functions begin with "**let rec**"

## Assignment Project Exam Helps Defining functions

- Nonrecursive functions:

```
let add_one (x:int) : int = 1 + x  
let add_two (x:int) : int = add_one (add_one x)
```

<https://powcoder.com>

Add WeChat powcoder

definition of add\_one  
must come before use

## Assignment Project Exam Helps

- Nonrecursive functions:

```
let add_one (x:int) : int = 1 + x
```

```
let add_two (x:int) : int = add_one (add_one x)
```

<https://powcoder.com>

- With a local definition:

local function definition  
hidden from clients

```
let add_two' (x:int) : int =  
  let add_one x = 1 + x in  
    add_one (add_one x)
```

Note that there are no types. OCaml figures them out.

Good style: types on top-level definitions

## Assignment Project Exam Help Types for Functions

Some functions: [Add WeChat powcoder](https://powcoder.com)

```
let add_one (x:int) : int = 1 + x

let add_two (x:int) : int = add_one (add_one x)
```

```
let add (x:int)(y:int) : int = x + y
```

[Assignment Project Exam Help](https://powcoder.com)

function with two arguments

[Add WeChat powcoder](https://powcoder.com)

Types for functions:

```
add_one : int -> int
```

```
add_two : int -> int
```

```
add : int -> int -> int
```

## Assignment Project Exam Help functions

Add WeChat powcoder

General Rule:

If a function  $f : T1 \rightarrow T2$

and an argument  $e : T1$

then  $f e : T2$

<https://powcoder.com>

Add WeChat powcoder

Example:

```
add_one : int -> int
```

```
3 + 4 : int
```

```
add_one (3 + 4) : int
```

## Assignment Project Exam Help functions

- Recall the type of add.

Definition:

```
let add (x:int) (y:int) : int =  
  x + y
```

<https://powcoder.com>

Type:

[Add WeChat powcoder](https://powcoder.com)

```
add : int -> int -> int
```

```

```
let y = 17;
```

```
munge (y > 17) : ??
```

```
munge true (f (munge false 3)) : ??  
f : string -> int
```

```
munge true (g munge) : ??  
g : (bool -> int -> string) -> int
```

## Assignment Project Exam Help One key thing to remember

- If you have ~~Add WeChat powcoder~~ a function f with a type like this:

A -> B -> C -> D -> E -> F

- Then each time you add an argument, you can get the type of the result by ~~Assignment Project Exam Help~~ Knocking off the first type in the series

<https://powcoder.com>

f a1 : B -> ~~Add WeChat powcoder~~ A -> D -> E -> F (if a1 : A)

f a1 a2 : C -> D -> E -> F (if a2 : B)

f a1 a2 a3 : D -> E -> F (if a3 : C)

f a1 a2 a3 a4 a5 : F (if a4 : D and a5 : E)

## Assignment Project Exam Help Tuples

- Here's a tuple with 2 fields:

(4.0, 5.0) : float \* float

- Here's a tuple with 3 fields:

Assignment Project Exam Help

(4.0, 5, "hello") : float \* int \* string

**SUMMARY:**

**BASIC FUNCTIONAL PROGRAMMING**

## Assignment Project Exam Help Writing Functions Over Typed Data

Steps to writing functions over typed data:

1. Write down the function and argument names
2. Write down argument and result types
3. Write down some examples (in a comment)
4. Deconstruct input data structures
5. Build new output values
6. Clean up by identifying repeated patterns

For tuple types: [Add WeChat powcoder](https://powcoder.com)

- when the **input** has type  $t_1 * t_2$ 
  - use `let (x,y) = ...` to **deconstruct**
- when the **output** has type  $t_1 * t_2$ 
  - use `(e1, e2)` to **construct**

We will see this paradigm repeat itself over and over
