Assignment Project Exam Help OCaml So Far

- We have seen a number of basic types:
 - int
 - float
 - char
 - string
 - bool
- We have seen a few structured types:
 - pairs
 - tuples
 - options
 - lists
- In this lecture, we will see some more general ways to define our own new types and data structures

Assignment Project Exam Help Type Abbreviations

- We have already seen some type abbreviations:

```
type point = float * float
```

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Assignment Project Exam Help Type Abbreviations

- We have already seen some type abbreviations:

```
type point = float * float
```

- These abbreviations can be helpful documentation:

<https://powcoder.com>

```
let distance (p1:point) (p2:point) : float =
  let square x = x *. x in
  let (x1, y1) = p1 in
  let (x2, y2) = p2 in
  sqrt (square (x2 -. x1) +. square (y2 -. y1))
```

- But they add nothing of *substance* to the language
 - they are **equal** in every way to an existing type

Assignment Project Exam Help Type Abbreviations

- We have already seen some type abbreviations:

```
type point = float * float
```

- As far as OCaml is concerned, you could have written:

```
https://powcoder.com
let distance (p1:float*float)
            (p2:float*float) : float =
  let square x = x *. x in
  let (x1,y1) = p1 in
  let (x2,y2) = p2 in
  sqrt (square (x2 -. x1) +. square (y2 -. y1))
```

- Since the types are equal, you can *substitute* the definition for the name wherever you want
 - we have not added any new data structures

<https://powcoder.com>

DATA TYPES

Assignment Project Exam Help Data types

- OCaml provides a general mechanism called a **data type** for defining new data structures that consist of many alternatives

```
type my_bool = Tru | Fal
```

Assignment Project Exam Help

https://powcoder.com

Add WeChat powcoder

a value with type **my_bool**
is one of two things:

- **Tru**, or
- **Fal**

read the " | " as "or"

Assignment Project Exam Help Data types

- OCaml provides a general mechanism called a **data type** for defining new data structures that consist of many alternatives

```
type my_bool = Tru | Fal
```

Assignment Project Exam Help

<https://powcoder.com>

Tru and Fal are called
"constructors"

a value with type **my_bool**
is one of two things:

- Tru, or
- Fal

read the " | " as "or"

Assignment Project Exam Help Data types

- OCaml provides a general mechanism called a **data type** for defining new data structures that consist of many alternatives

```
type my_bool = True | False
```

Assignment Project Exam Help

```
type color = Blue | Yellow | Green | Red
```

Add WeChat powcoder

there's no need to stop at 2 cases; define as many alternatives as you want

Assignment Project Exam Help Data types

- OCaml provides a general mechanism called a **data type** for defining new data structures that consist of many alternatives

```
type my_bool = Tru | Fal
```

Assignment Project Exam Help

```
type color = Blue | Yellow | Green | Red
```

- Creating values:

```
let b1 : my_bool = Tru  
let b2 : my_bool = Fal  
let c1 : color = Yellow  
let c2 : color = Red
```

use constructors to create values

Assignment Project Exam Help Data types

Add WeChat powcoder

```
type color = Blue | Yellow | Green | Red
```

```
let c1 : color = Yellow
```

```
let c2 : color = Red
```

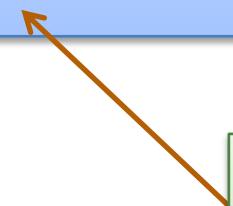

Assignment Project Exam Help

- Using data type values:

```
let print_color (c:color) : unit =
  match c with
  | Blue ->
  | Yellow ->
  | Green ->
  | Red ->
```

Add WeChat powcoder

use pattern matching to determine which color you have; act accordingly

Assignment Project Exam Help Data types

Add WeChat powcoder

```
type color = Blue | Yellow | Green | Red
```

```
let c1 : color = Yellow
```

```
let c2 : color = Red
```

Assignment Project Exam Help

- Using data type values:

```
let print_color (c:color) : unit =
  match c with
  | Blue -> print_string "blue"
  | Yellow -> print_string "yellow"
  | Green -> print_string "green"
  | Red -> print_string "red"
```

Assignment Project Exam Help Data types

Add WeChat powcoder

```
type color = Blue | Yellow | Green | Red
```

```
let c1 : color = Yellow
```

```
let c2 : color = Red
```

Assignment Project Exam Help

- Using data type values:

```
let print_color (c:color) : unit =
  match c with
  | Blue -> print_string "blue"
  | Yellow -> print_string "yellow"
  | Green -> print_string "green"
  | Red -> print_string "red"
```

Why not just use strings to represent colors instead of defining a new type?

Assignment Project Exam Help Data types

Add WeChat powcoder

```
type color = Blue | Yellow | Green | Red
```

oops!:

```
let print_color (c:color) : unit =
  match c with
  | Blue -> print_string "blue"
  | Yellow -> print_string "yellow"
  | Red -> print_string "red"
```

Add WeChat powcoder

Warning 8: this pattern-matching is not exhaustive.
Here is an example of a value that is not matched:
Green

Assignment Project Exam Help Data types

Add WeChat powcoder

```
type color = Blue | Yellow | Green | Red
```

oops!:

```
let print_color (c:color) : unit =
  match c with
  | Blue -> print_string "blue"
  | Yellow -> print_string "yellow"
  | Red -> print_string "red"
```

Add WeChat powcoder

Warning 8: this pattern-matching is not exhaustive.
Here is an example of a value that is not matched:
Green

OCaml's datatype mechanism allow you to create types
that contain *precisely* the values you want!

Data Types Can Carry Additional Values

- Data types are more than just enumerations of constants:

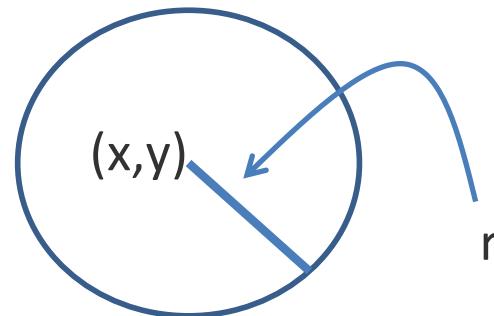

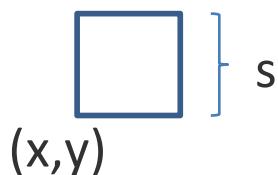

```
type point = float * float
```

```
type simple_shape =  
    Circle of point * float
```

```
    | Square of point * float
```

Add WeChat powcoder
<https://powcoder.com>

- Read as: a **simple_shape** is either:
 - a **Circle**, which contains a **pair** of a **point** and **float**, or
 - a **Square**, which contains a **pair** of a **point** and **float**

Data Types Can Carry Additional Values

- Data types are more than just enumerations of constants:

```
type point = float * float
```

```
type simple_shape =
  Circle of point * float
  | Square of point * float
```

```
let origin : point = (0.0, 0.0)
```

```
let circ1 : simple_shape = Circle (origin, 1.0)
let circ2 : simple_shape = Circle ((1.0, 1.0), 5.0)
let square : simple_shape = Square (origin, 2.3)
```

Data Types Can Carry Additional Values

- Data types are more than just enumerations of constants:

```
type point = float * float

type simple_shape =
    Circle of point * float
  | Square of point * float

let simple_area (s:simple_shape) : float =
  match s with
  | Circle (_, radius) -> 3.14 *. radius *. radius
  | Square (_, side) -> side *. side
```

Assignment Project Exam Help

- Data types are more than just enumerations of constants:

```
type point = float * float
```

```
type simple_shape =
  Circle of point * float
  | Square of point * float
```

```
let simple_area (s:simple_shape) : float =
  match s with
  | Circle (_, radius) -> 3.14 *. radius *. radius
  | Square (_, side) -> side *. side
```

```
type my_shape = point * float
```

```
let simple_area (s:my_shape) : float =
  (3.14 *. radius *. radius) ?? or ?? (side *. side)
```

Assignment Project Exam Help More General Shapes

Add WeChat powcoder

```
type point = float * float
```

```
type shape =
  Square of float
  | Ellipse of float * float
  | RtTriangle of float * float
  | Polygon of point list
```

Assignment Project Exam Help

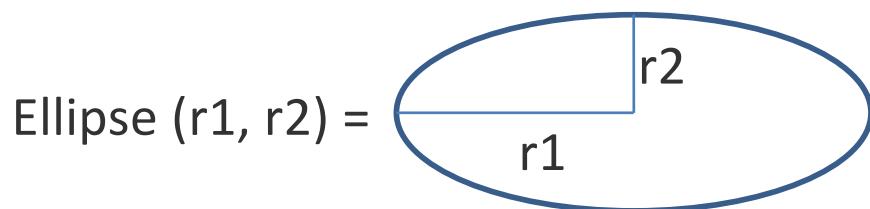

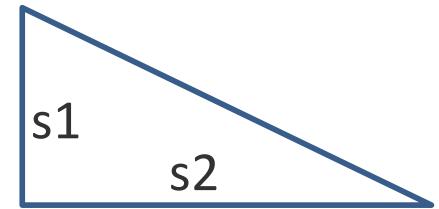

<https://powcoder.com>

Add WeChat powcoder

Square s =

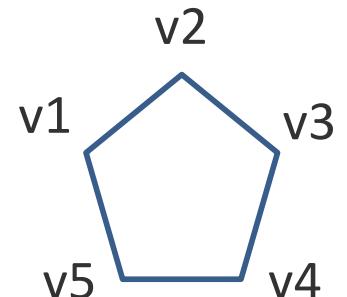

RtTriangle (s1, s2) =

Ellipse (r1, r2) =

Polygon [v1; ...; v5] =

Assignment Project Exam Help More General Shapes

Add WeChat powcoder

```
type point = float * float
```

```
type radius = float
```

```
type side = float
```

```
type shape =
```

```
    | Square of side
```

```
    | Ellipse of radius * radius
```

```
    | RtTriangle of side * side
```

```
    | Polygon of point list
```

Type abbreviations can aid readability

Assignment Project Exam Help

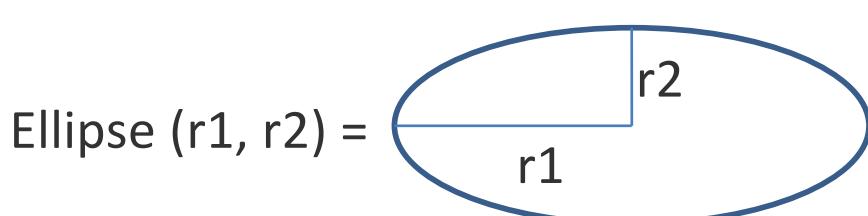

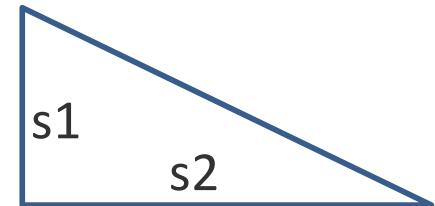

<https://powcoder.com>

Add WeChat powcoder

Square s =

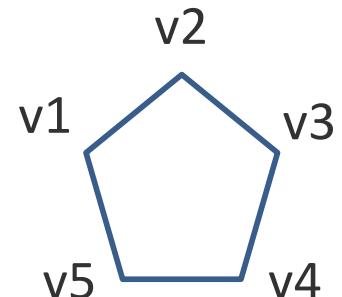

RtTriangle (s1, s2) =

Ellipse (r1, r2) =

RtTriangle [v1; ...; v5] =

Assignment Project Exam Help More General Shapes

Add WeChat powcoder

```
type point = float * float  
type radius = float  
type side = float
```

Square builds a shape from a single side

```
type shape =  
  Square of side  
 | Ellipse of radius * radius  
 | RtTriangle of side * side  
 | Polygon of point list
```

Ellipse builds a shape from a pair of radii

<https://powcoder.com>

```
let sq   : shape = Square 17.0  
let ell  : shape = Ellipse (1.0, 2.0)  
let rt   : shape = RtTriangle (1.0, 1.0)  
let poly : shape = Polygon [(0., 0.); (1., 0.); (0.; 1.)]
```

RtTriangle builds a shape from a pair of sides

they are all shapes;
they are constructed in different ways

Polygon builds a shape from a list of points
(where each point is itself a pair)

Assignment Project Exam Help More General Shapes

Add WeChat powcoder

```
type point = float * float
type radius = float
type side = float
```

```
type shape =
  Square of side
  | Ellipse of radius * radius
  | RtTriangle of side * side
  | Polygon of point list
```

a data type also defines
a pattern for matching

Assignment Project Exam Help

```
let area (s : shape) : float
  match s with
  | Square s ->
  | Ellipse (r1, r2) ->
  | RtTriangle (s1, s2) ->
  | Polygon ps ->
```

Add WeChat powcoder

Assignment Project Exam Help

More General Shapes

Add WeChat powcoder

```
type point = float * float  
type radius = float  
type side = float
```

```
type shape =  
  Square of side  
  | Ellipse of radius * radius  
  | RtTriangle of side * side  
  | Polygon of point list
```

a data type also defines
a pattern for matching

Assignment Project Exam Help

```
let area (s : shape) : float  
match s with  
| Square s ->  
| Ellipse (r1, r2) ->  
| RtTriangle (s1, s2) ->  
| Polygon ps ->
```

Square carries a value
with type **float** so **s** is
a pattern for float values

RtTriangle carries a value
with type **float * float**
so **(s1, s2)** is a pattern
for that type

Assignment Project Exam Help More General Shapes

Add WeChat powcoder

```
type point = float * float
type radius = float
type side = float
```

```
type shape =
  Square of side
  | Ellipse of radius * radius
  | RtTriangle of side * side
  | Polygon of point list
```

a data type also defines
a pattern for matching

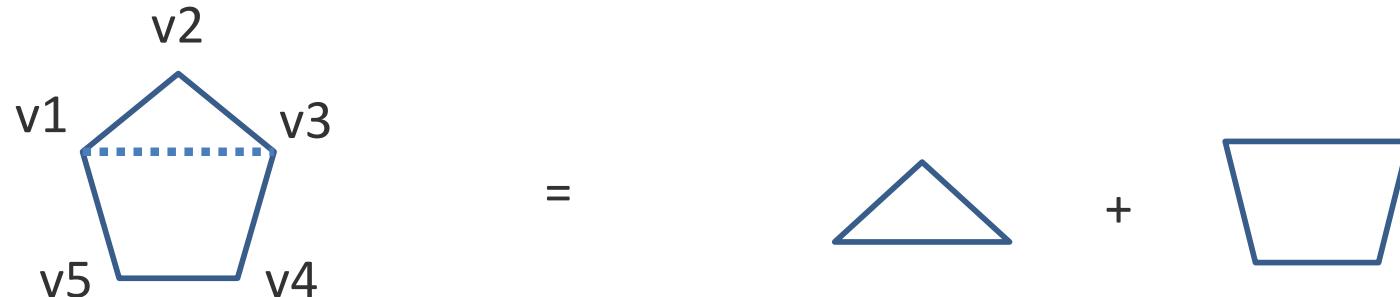

Assignment Project Exam Help

```
let area (s : shape) : float
  match s with
  | Square s -> s *. s
  | Ellipse (r1, r2) -> pi *. r1 *. r2
  | RtTriangle (s1, s2) -> s1 *. s2 /. 2.
  | Polygon ps -> ???
```

Add WeChat powcoder

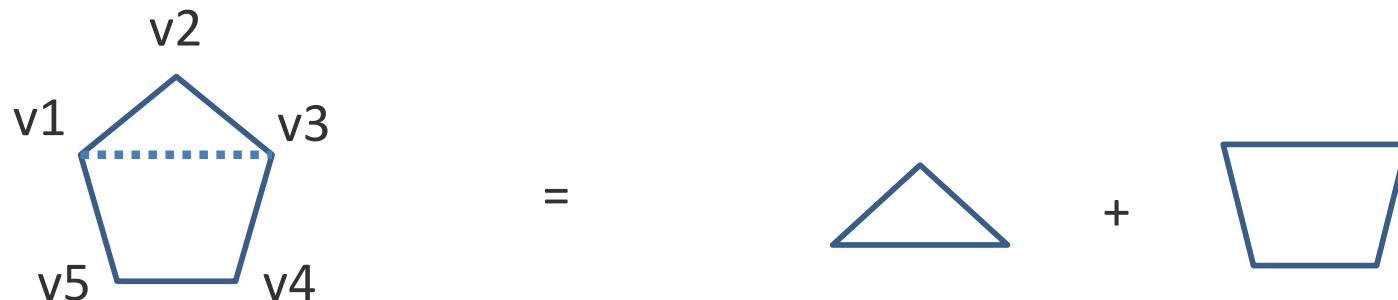

Assignment Project Exam Help Computing Area

- How do we compute polygon area?
- For convex polygons:
 - Case: the polygon has fewer than 3 points:
 - it has 0 area! (it is a line or a point or nothing at all)
 - Case: the polygon has 3 or more points:
 - Compute the area of the triangle formed by the first 3 vertices
 - Delete the second vertex to form a new polygon
 - Sum the area of the triangle and the new polygon

Assignment Project Exam Help Computing Area

- How do we compute polygon area?
- For convex polygons:
 - Case: the polygon has fewer than 3 points:
 - it has 0 area! (it is a line or a point or nothing at all)
 - Case: the polygon has 3 points:
 - Compute the area of the triangle formed by the first 3 vertices
 - Delete the second vertex to form a new polygon
 - Sum the area of the triangle and the new polygon
- Note: This is a beautiful inductive algorithm:
 - the area of a polygon with n points is computed in terms of a smaller polygon with only $n-1$ points!

Assignment Project Exam Help Computing Area

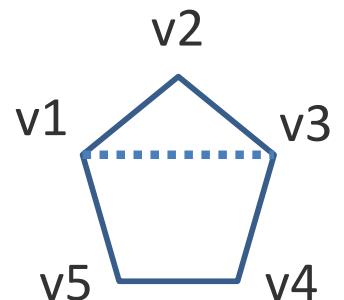

Add WeChat powcoder

```
let area (s : shape) : float =  
  match s with  
  | Square s -> s *. s  
  | Ellipse (r1, r2) -> r1 *. r2  
  | RtTriangle (s1, s2) -> s1 *. s2 /. 2.  
  | Polygon ps -> poly_area ps
```

This pattern says the list has at least 3 items

Assignment Project Exam Help

```
let rec poly_area (ps : point list) : float =  
  match ps with  
  | p1 :: p2 :: p3 :: tail ->  
    tri_area p1 p2 p3 +. poly_area (p1 :: p3 :: tail)  
  | _ -> 0.
```

=

Assignment Project Exam Help Computing Area

Add WeChat powcoder

```
let tri_area (p1:point) (p2:point) (p3:point) : float =
  let a = distance p1 p2 in
  let b = distance p2 p3 in
  let c = distance p3 p1 in
  let s = 0.5 *. (a +. b +. c) in
  sqrt (s *. (s -. a) *. (s -. b) *. (s -. c))
```

Assignment Project Exam Help

```
let rec poly_area (ps: point list): float =
  match ps with
  | p1 :: p2 :: p3 :: tail > Add WeChat powcoder
    tri_area p1 p2 p3 +. poly_area (p1 :: p3 :: tail)
  | _ -> 0.
```

```
let area (s : shape) : float =
  match s with
  | Square s -> s *. s
  | Ellipse (r1, r2) -> pi *. r1 *. r2
  | RtTriangle (s1, s2) -> s1 *. s2 /. 2.
  | Polygon ps -> poly_area ps
```

        if k < k' then
          Node (k', v', insert left k v, right)
        else if k > k' then
          Node (k', v', left, insert right k v)
        else
          Node (k, v, left, right)
```

Assignment Project Exam Help Inductive data types: Another Example

- We can use the type "int" to represent natural numbers
 - but that is kind of broken: it also contains negative numbers
 - we have to use a dynamic test and a default value:

```
let double(n : int) : int =  
  if n < 0 then  
    0  
  else  
    double_hat n
```

Assignment Project Exam Help Inductive data types: Another Example

- We can use the type "int" to represent natural numbers
 - but that is kind of broken: it also contains negative numbers
 - we have to use a dynamic test and a default value:
 - or raise an exception

```
let double (n : int) : int =  
  if n < 0 then  
    raise Failure ("negative input!")  
  else  
    double_hat n
```

- it would be nice if there was a way to define the natural numbers **exactly**, and use OCaml's type system to guarantee no client ever attempts to double a negative number

Assignment Project Exam Help Inductive data types

- Recall, a natural number n is either:
 - zero, or
 - $m + 1$
- We use a data type to represent this definition exactly:

let rec double_nat (n : nat) : nat =  
  match n with  
  | Zero -> Zero  
  | Succ m -> Succ (Succ (double_nat m))
```

Assignment Project Exam Help Summary

- OCaml data types: a powerful mechanism for defining complex data structures:
 - They are precise
 - contain exactly the elements you want, not more elements
 - They are general
 - recursive, non-recursive (mutually recursive and polymorphic)
 - The type checker helps you detect errors
 - missing cases in your functions

PARAMETERIZED TYPE DEFINITIONS

Assignment Project Exam Help
type ('key, 'val) tree =

Leaf Add WeChat powcoder

| Node of 'key * 'val * ('key, 'val) tree * ('key, 'val) tree

type 'a stree = (string, 'a) tree

Assignment Project Exam Help

<https://powcoder.com>

type sitree = int stree

Add WeChat powcoder

General form:

definition:

type 'x f = body

use:

arg f

A more conventional notation
would have been (but is not ML):

definition:

type f x = body

use:

f arg

Assignment Project Exam Help Take-home Message

- Think of parameterized types like functions:
 - a function that takes a type as an argument
 - produces a type as a result
- Theoretical basis:
 - System F-omega
 - a typed lambda calculus with general type-level functions as well as value-level functions
